GENERAL

The flight compartment is located at the forward end of the upper lobe of the fuselage. The compartment is pressurized and extends from the windshield to the pressure bulkhead at Station 550.

Accommodations are provided for a total of 12 personnel in the flight compartment, consisting of an operating crew of 4, a relief crew of 3, and provisions for an additional 5 persons who may be required on a given mission.

For convenience in the description of the flight compartment, it is divided into three sections; a forward section which includes the crew flight stations, a center section which includes the relief crew quarters; and an aft section which includes the service facilities for the crew.

Entrance to the flight compartment is provided at the forward end by a stairway leading from the lower level through a pressurized door in the upper floor and at the aft end through a hatch in the pressure bulkhead leading from the wing and aft fuselage.

The upper entrance to the decompression chamber (which is included in the mock-up as a study item only) is located in the forward section of the flight compartment at Station 365 on the right-hand side of the airplane.

The sidewall lining for the compartment will be of coated fabric, snapped on for easy removal and replacement.
